

Delegation Plan: Claude Corps Fellowship Application

This is a task from Anthropic's AI Fluency: Framework & Foundations course.

Project: Applying to the Claude Corps Fellowship (Anthropic / CodePath)

Goal: Submit a strong, authentic application that reflects my real experience and voice, while using AI strategically to work faster and think more clearly.

My Strengths (Abdoul)

- Firsthand knowledge of my own experiences, motivations, and the specific moments that shaped why I want this
- Judgment about what's actually true and worth including
- Final say on tone, voice, and what I'm comfortable claiming about myself
- Context about my own AI usage habits and comfort level (which the program is specifically evaluating)

Claude's Strengths (AI)

- Fast research and synthesis (program details, host orgs, requirements)
- Structuring a messy pile of ideas into a clear outline
- Drafting scaffolding and tightening prose
- Playing devil's advocate / mock interviewer
- Catching typos, repetition, and unclear phrasing
- Tracking deadlines and requirements

Task Breakdown

Task	Who Leads	Why
Research program details, host orgs, deadlines	AI	Fast, factual, low personal stakes
Brainstorm which experiences/stories to feature	Me, with AI as a sounding board	Only I know what actually happened and mattered
Structure/outline the narrative	AI drafts, I approve	Organizing is mechanical; the content is mine

Write the first draft	Me	Needs to be true, specific, and in my voice from the start
Tighten and edit prose	AI suggests, I decide	Speeds up editing without replacing my voice
Final read-through and voice check	Me	Only I can confirm "this sounds like me"
Mock interview / Q&A practice	AI	Low-stakes way to stress-test answers before it counts
Deadline tracking and checklist	AI	Reduces logistical overhead

Guardrails I'm Setting for Myself

1. No sentence goes in the final application that I haven't personally verified as true and specific to me.
2. If a draft sounds "AI-polished" instead of like me, I rewrite it rather than lightly edit it.
3. Any mention of how I use AI in my application will be an honest description of my actual habits, not an aspirational one.
4. I'll read the final version out loud before submitting, if it doesn't sound like something I'd actually say, it gets revised.

Notes / Reflection

What worked: splitting "words vs. code" cleanly, I wrote every claim about myself, Claude built the site around it, and the final result stayed honest instead of AI-flavored. The "AI drafts, I approve" pattern was fast for structure (site sections, table layouts, the cover letter skeleton), but every paragraph still needed a full rewrite pass before it sounded like me, not a lighter edit. Guardrail #4 (read it out loud before it's real) did real work: it's what caught overconfident phrasing in my fit-mapping section and language that read AI-polished instead of like me.

What I'd delegate differently next time: I'd set tone guardrails (no em dashes, no arrogant framing, no overstating unfinished work) upfront instead of catching them after a full draft was already written; that cost more editing passes than it needed to. I'd also have Claude flag missing or unverified details (like an unattached PRD, or a claim I hadn't fact-checked yet) as soon as they came up, rather than mid-build. Voice-matching and structural build work are genuinely different tasks; next time I'd separate them from the start instead of letting one big draft blur the two.
